EDUCATION

Southern Methodist University

Dallas, Texas

B.A. Computer Science and B.S. Data Science, Cybersecurity Concentration, Business Minor

Expected May 2027

Relevant Coursework: Computer Networks and Distributed Systems, Operating Systems, Data Structures, Fundamentals of Algorithms, Computer Organization, Discrete Computational Structures, Artificial Intelligence, Linear Algebra, Statistical Methods for Engineers, Principles of Computer Science I and II

EXPERIENCE

GM Financial

Irving, Texas

Cybersecurity Intern (Returning Intern)

May 2026 – Present

Cybersecurity Intern

May 2025 – Aug 2025

- Mapped Active Directory privilege escalation paths across a large enterprise domain using PowerShell and internal tooling, surfacing exploitable attack vectors for remediation
- Triaged hundreds of user-reported phishing emails, cutting false positives and strengthening the organization's threat response process
- Developed a threat-based risk assessment methodology aligning MITRE ATT&CK and NIST frameworks with control mappings and a weighted scoring model for inherent and residual risk classification
- Built a NIST controls database in a governance automation platform, improving policy visibility and compliance tracking
- Presented findings to technical stakeholders and executive leadership, including a capstone briefing to the Chief Information Security Officer

Software Automation Startup

Southlake, Texas

Founder and Software Developer

March 2021 – Nov 2021

- Founded and operated a software company, building a Python client that reverse-engineered undocumented web APIs to automate multi-step request flows
- Maintained reliability against frequent upstream changes to page structure, session handling, and request validation, keeping the product working across dozens of sites
- Supported hundreds of paying customers directly, diagnosing network and session configuration failures under sustained load

PROJECTS

Operation Vermillion Drift – Azure Cloud Attack Range

Self-Directed Research, Jun–Jul 2026

- Built a deliberately vulnerable Azure environment in Terraform and executed a full external kill chain from an anonymous public URL to Contributor-level control of an Azure resource group
- Extracted hardcoded secrets from a publicly downloadable Azure Function deployment package and forged an HS256 admin JWT to bypass registration and reach protected API routes
- Chained server-side request forgery into a local-file pivot to dump the function runtime environment, then replayed a stolen virtual machine managed-identity token from IMDS against Azure Resource Manager
- Mapped each stage to MITRE ATT&CK for Cloud and authored a deployment runbook that cut range rebuild time from a multi-hour investigation to a 25-minute apply

Login Security System – Secure Mobile Application

Nov 2024 – May 2025

- Built a mobile application with progressive authentication hardening, adding password encryption and two-factor authentication across development iterations
- Applied cryptographic libraries and authentication protocols to protect stored credentials and session data at rest

SKILLS

Languages: Python, Java, JavaScript, C++, C#, PowerShell, HTML

Cloud and Tools: Microsoft Azure (Entra ID, Functions, Storage, Resource Manager API), Azure CLI, Terraform, MicroBurst, Burp Suite, Windows RSAT, Active Directory PowerShell module, Git

Frameworks: MITRE ATT&CK (Enterprise and Cloud), NIST CSF

Certifications: Microsoft SC-900; CARTP (in progress)
